

Real-Time Ports Dashboard

Detailed View of Port Level Settings and Statistics

BATS' Real-Time Ports Dashboard is an innovative Web tool designed to provide Members real-time information for ports at both the primary and secondary data centers, including open orders, rejects and TCP retransmission counts at the port level. Also included are various connection details, default port attributes, graphs for various statistics and counts for rejects by reject type.

Statistics may be viewed in intervals ranging from the last five minutes up to the entire current day. This tool can be used to review how much traffic each port receives, the provider of the port, the IP addresses and many more port details, all in real-time. Refer to the **Main Port Status Page** and **Port Detail Window** images.

The Real-Time Ports Dashboard is available through www.batstrading.com and is accessible via the LOGIN link in the top right corner of the web page. Permission to view this feature, cancellation authority and new accounts may be requested through the BATS Trade Desk, 913.815.7001 or tradedesk@batstrading.com.
